BLEED

When working on a design, you can either show the preview with or without the cutting bleed.
We recommend using a bleed of 3 mm.

Use the same line color for all the decals in your file. Make sure all the cutting lines are separate on the top layer of your file. The best way to do this is:

-Select one cutting line.
-Go to: Select (top bar) > Same > Line color.
-Go to the layers category in your workspace and drag the little square to a new layer.
-Always make sure all your cutting lines are on a separate layer to prevent mistakes.

Use a cutting bleed of 3 mm, this is important to prevent white edges after cutting.

PRICING

We can print up to **1240mm** in width, and **950mm** in length (longer or wider files will not be accepted). These should be the dimensions of your print file. You may always make them smaller, but never bigger. Nearly all MX bikes fit on these dimensions. To get the most out of your file, add other decals or logo's of your company to fill up remaining area's. Make sure these also have a 3mm bleed.

Watch out for tiny details and sharp edges, as these can cause trouble during the cutting process. If you add small miniplates, make sure you round the edges.

1220mm X 950mm print (MX graphics gloss): €85,- not including VAT
1220mm X 950mm print (MX graphics matte): €95,- not including VAT (if you have us print 2 complete matte sets in one go, the price will drop to €85,- for each print)
1220mm X 950mm print (MX Helmet graphics gloss): €85,- not including VAT
1220mm X 950mm print (MX Helmet graphics matte): €95,- not including VAT

In general, we ask €1,- for 1220mm X 12mm. If a print file is shorter than 500mm in length, we ask an additional €10,- to compensate for waste material.

We recommend sending 2 full print files at once, since **shipping** will then be **FREE**. If you only have 1 print file, shipping will be calculated accordingly.

MATERIALS

For our vinyl and laminate for dirtbikes we use **Substance Ultracurve X1** for our print vinyl and the **Substance Ultracurve 1500**. Of all the vinyls and laminates we have tested over the years, these are without a doubt the best. The vinyl has an air-release adhesive that makes application easier and the laminate is extremely shiny and durable.

For our matte decals we use the same print vinyl, but with a different laminate; **Substance Ultracurve 1500 Matte**.

For helmet decals we use **Substance Ultracurve X1** and **Substance Ultracurve 1000.** The prices are the same. If you have both helmet decals and dirtbike decals, make sure you add them as a separate print file. Do NOT mix these. If you do, we cannot be held responsible for mistakes.

SHIPPING

Each decal will be cut out separately. We will package your decals in a sturdy, custom made cardboard box especially made for shipping decals. There are no prints on the packaging and your customer won't be able to see that we made them. If you have multiple print files sent to us for multiple customers, we can ship and package each print seperately for an additional EUR2,-. If all the decals can go in one box, no extra free will be charged.

COLORS

Colors are very important. If a customer wants a KTM graphics kit, the orange should match that of KTM. We can print a very vibrant, 99% exact KTM orange unlike many other companies. We can also print a near perfect Yamaha blue and very vibrant reds.

It is possible to order our color samples. Without our color samples to chose from, we cannot guarantee that they will be 100% accurate since every printer prints colors differently (and many, many more things influences color). Blue from a .PDF file will NOT be the same as a blue from a .AI file for example).

To print a vibrant Yamaha blue, we need the color preset to be **RGB.** For some reason, our printer cannot print the same vibrant blue in CMYK. So, when you have decals that feature the Yamaha blue color, place them in a SEPERATE print file, and do not mix them with decals that can be printed in CMYK.

To print the KTM orange, vibrant red or Kawasaki green, the file has to be a **CMYK**. The norm is always CMYK, except for Yamaha blue. In your printfile, make sure you add the information needed for us. If something has to be KTM orange, make sure you tell us it has to be KTM orange since we have to manually insert the amount of ink the printer has to use. This cannot be done in your design software, so just add a line of text together with a small color sample like this:

KTM ORANGE

YAMAHA BLUE

Make sure that you do **NOT** accidentically add two different oranges. If they both have a different CMYK value, only one will be the correct KTM orange in the end, and the other will be different. Sounds tricky, but once you are used to it nothing can go wrong. Also if you want to use KTM orange, be careful not to use any gradients (or use the color halftone option), no fading drop shadows and no .png's. If you do want a png, make sure it's in a clipping mask.

ESTIMATED PRODUCTION TIME

If your print file is correct and everything is clear to us, expect your decals to ship within 2 to 5 bussiness-days. The shipping time depends on what country they have to be shipped to. Within the Netherlands it is 1 bussiness day, to Belgium 1 or 2, to Germany 2 or 3. For other countries we can look it up if you want to know.

If you need your order faster, contact us to see what we can do.
